

AMENDMENTS TO THE CLAIMS:

Please amend the claims as follows:

1. (original) An improved p-type gallium nitride-based semiconductor device comprising:
 - a device structure that includes at least one p-type Group III nitride layer that includes some gallium;
 - a first silicon dioxide layer on said p-type layer;
 - a layer of a Group II metal source composition on said first SiO₂ layer; and
 - a second SiO₂ layer on said Group II metal source composition layer.

2. (original) A semiconductor device according to Claim 1 wherein said device structure comprises:
 - a conductive silicon carbide substrate;
 - a conductive buffer layer on said silicon carbide substrate for providing a crystal transition between said substrate and said Group III nitride portions of said device; and
 - an n-type Group III nitride layer on said buffer layer.

3. (original) A device according to Claim 1 wherein said first silicon dioxide layer is thick enough to create vacancies to a depth in said p-type layer that encourages atoms of said Group II metal to diffuse therein while still permitting diffusion from said Group II metal source composition through said first SiO₂ layer and into said p-type layer.

4. (original) A device according to Claim 1 wherein:
 - said first SiO₂ layer is about 1000 Å thick;
 - said Group II metal source composition layer is about 1000 Å thick; and
 - said second SiO₂ layer is about 2500 Å thick.

5. (original) A device according to Claim 1 wherein said Group III nitride comprises GaN and said source composition layer is selected from the group consisting of magnesium and zinc.

6. (withdrawn) A method of activating the p-type layers and passivating a Group III nitride device, the method comprising: thermally annealing the structure according to Claim 1.

7. (previously amended) A device structure according to Claim 2 wherein said substrate is n-type and has a carrier concentration of between about $1 \times 10^{16} \text{ cm}^{-3}$ and about $1 \times 10^{19} \text{ cm}^{-3}$.

8. (original) A device according to Claim 1 wherein said Group II metal source composition layer comprises a Group II metal-containing compound.

9. (original) A device according to Claim 8 wherein said compound is selected from the group consisting of magnesium nitride and zinc phosphide.

10. (previously amended) A device according to Claim 1 wherein said p-type gallium nitride layer has the formula $\text{Ga}_x\text{Al}_y\text{In}_{1-x-y}\text{N}$ where $0 < x \leq 1$ and $0 \leq y \leq 1$.

11. (original) A device according to Claim 1 comprising a plurality of silicon dioxide portions on said p-type Group III nitride layer, with a respective portion of said source composition on each said silicon dioxide portion.

12. (currently amended) ~~A device according to Claim 11~~ An improved p-type gallium nitride-based semiconductor device comprising:

a device structure that includes at least one p-type Group III nitride layer that includes some gallium;

a plurality of silicon dioxide portions on said p-type Group III nitride layer;

a portion of a Group II metal source composition on each of said silicon dioxide portions; and

a second silicon dioxide layer on said Group II metal source composition,

wherein said second silicon dioxide layer is limited to said source composition portions.

13. (original) A device according to Claim 11 wherein said second silicon dioxide portion covers said source composition portions and portions of said p-type Group III nitride layer.

14. (original) An improved p-type gallium nitride-based device comprising:

a conductive silicon carbide substrate;

a conductive buffer layer on said silicon carbide substrate for providing a crystal transition between said substrate and said GaN portions of said device;

an n-type GaN layer on said buffer layer;

a p-type GaN layer on said n-type layer;

a first silicon dioxide layer on said p-type layer;

a magnesium layer on said first SiO₂ layer for supplying p-type dopant to said p-type layer; and

a second SiO₂ layer on said Mg layer for passivating said device;

said first silicon dioxide layer being thick enough to create vacancies to a required depth in said p-GaN layer when said device is heated to temperatures between about 750° and 950° C while still permitting diffusion from the magnesium layer through said first SiO₂ layer and into the p-GaN layer at such temperatures.

15. (original) A device according to Claim 14 wherein said substrate is n-type.
16. (original) A device according to Claim 14 wherein said buffer is selected from the group consisting of: graded layers of Group III nitrides, homogeneous layers of Group III nitrides, heterogeneous layers of Group III nitrides and combinations thereof.
17. (original) A device according to Claim 14 wherein said n-type layer comprises $\text{Al}_x\text{In}_y\text{Ga}_{1-x-y}\text{N}$ where $0 \leq x \leq 1$ and $0 \leq y \leq 1$
18. (currently amended) A device according to Claim 14 wherein said p-type layer comprises ~~$\text{Ga}_x\text{Al}_{1-x}\text{In}_y\text{N}$~~ $\text{Ga}_x\text{Al}_y\text{In}_{1-x-y}\text{N}$ where $0 < x \leq 1$ and $0 \leq y \leq 1$.
19. (withdrawn) A method of activating the p-type layers and passivating a Group III nitride device, the method comprising thermally annealing a structure that includes at least the following elements:
- at least one p-type Group III nitride layer that includes some gallium;
 - a first silicon dioxide layer on said p-type layer;
 - a layer of a Group II metal source composition on said first SiO_2 layer; and
 - a second SiO_2 layer on said source composition layer layer.
20. (withdrawn) A method according to Claim 19 comprising annealing the structure for a time sufficient for the structure to reach at temperature of between about 750° and 950° C.
21. (withdrawn) A method according to Claim 20 comprising annealing the structure to reach a temperature of between about 850° and 875° C.

22. (withdrawn) A method according to Claim 20 comprising annealing the structure for about 5 minutes.

23. (withdrawn) A method of increasing the activation of a p-type Group III nitride layer that includes some GaN, the method comprising:
forming a first layer of SiO₂ on the p-type layer;
forming a layer of a Group II metal source composition;
forming a second layer of SiO₂ on the metal layer; and
annealing the structure to diffuse the metal from the metal layer into the p-type gallium-containing layer and to activate metal atoms in the p-type layer.

24. (withdrawn) A method according to Claim 23 wherein the step of forming the first SiO₂ layer comprises forming the SiO₂ layer to a thickness sufficient to create gallium vacancies to a required depth in said p-type layer during the annealing step while still permitting magnesium to diffuse from the metal layer through said first SiO₂ layer and into activated positions in the p-type layer.

25. (withdrawn) A method according to Claim 23 comprising annealing the structure at a temperature and for a time sufficient to provide an activated p-type layer of at least about 1E17.

26. (withdrawn) A method according to Claim 25 comprising forming the SiO₂ layer to a thickness of about 1000 Å and annealing the structure for a time sufficient for the structure to reach at temperature of between about 750° and 950° C.

27. (withdrawn) A method according to Claim 26 comprising annealing the structure to reach a temperature of between about 850° and 875° C.

28. (withdrawn) A method according to Claim 26 comprising annealing the structure for about 5 minutes.

29. (withdrawn) A method according to Claim 23 comprising increasing the activation of a p-type GaN layer.

30. (withdrawn) A method according to Claim 23 wherein the step of forming the source composition layer comprises forming a layer of a metal selected from the group consisting of magnesium and zinc on the first SiO₂ layer.

31. (withdrawn) A method according to Claim 23 wherein the step of forming the source composition layer comprises forming a layer of a compound containing a Group II metal on the first SiO₂ layer.

32. (withdrawn) A method according to Claim 31 comprising forming a layer of selected from the group consisting of magnesium nitride and zinc phosphide.

33. (withdrawn) A method according to Claim 23 and further comprising removing the first and second SiO₂ layers and the metal source composition layer and depositing a silicon nitride cap on the remaining structure.

34. (withdrawn) A method according to Claim 33 wherein the step of removing the layers comprises etching the layers.

35. (withdrawn) A method of creating a p-type layer from a nominally n-type GaN layer, the method comprising:

forming a first layer of SiO₂ on the nominally n-type layer;

forming a layer of magnesium on the first SiO₂ layer;

forming a second layer of SiO₂ on the magnesium layer; and
annealing the structure to diffuse magnesium from the magnesium layer into the
nominally n-type GaN layer and to activate sufficient magnesium in the layer to produce p-
type characteristics.

36. (withdrawn) A method according to Claim 35 comprising annealing the structure
for a time sufficient for the structure to reach a temperature of between about 750° and 950°
C.

37. (withdrawn) A method according to Claim 36 comprising annealing the structure
to reach a temperature of between about 850° and 875° C.

38. (withdrawn) A method according to Claim 36 comprising annealing the structure
for about 5 minutes.

39. (withdrawn) A method of creating a p-type layer from a nominal n-type GaN
layer, the method comprising:

annealing the GaN layer in the presence of an adjacent SiO₂ layer, a layer of a Group
II metal source composition on the adjacent SiO₂ layer and a second SiO₂ layer on the metal
layer;

until the GaN layer demonstrates p-type characteristics.

40. (withdrawn) A method according to Claim 39 comprising annealing a GaN layer
having a n-type carrier concentration of 5E16 or less

41. (withdrawn) A method according to Claim 39 comprising annealing the GaN
layer until the GaN layer demonstrates a p-type carrier concentration of at least about 1E17.

42. (withdrawn) A method according to Claim 39 comprising annealing the structure for a time sufficient for the structure to reach a temperature of between about 750° and 950° C.

43. (withdrawn) A method according to Claim 42 comprising annealing the structure to reach a temperature of between about 850° and 875° C.

44. (withdrawn) A method according to Claim 42 comprising annealing the structure for about 5 minutes.
